iOS Interview Assessment Submission

Overview

The app loads transactions from the provided `transaction-list.json` file, displays them in a transaction list, and shows additional information on a details screen.

The project uses a feature-based structure for the transaction flow and separates networking, services, models, view models, views, navigation, resources, and shared utilities.

Requirements Covered

- ✓ Display a list of transactions. Show merchant name, description, and amount in the list
- ✓ Open a transaction details screen when a transaction is selected
- ✓ Show credit/debit transaction status on the details screen
- ✓ Show account information and amount on the details screen
- ✓ Show an expandable/collapsible tooltip
- ✓ Close the details screen and return to the transaction list
- ✓ Load the provided local JSON file instead of making a real API call
- ✓ Add unit tests where useful

Assessment Note

If given more time, I would improve the following areas:

1. Move hard-coded strings

Some UI text is currently hard-coded in views and view models. I would move these strings into a centralized constants file or localization files. This would make the project easier to maintain and prepare for future localization.

2. Improve error handling and retry behavior

The current error handling is simple. Next, I would add a better error state UI with a retry action.

3. Improve dependency injection

The app already uses protocols for services and networking, which makes the main logic testable. With more time, I would centralize dependency creation using a small dependency container. I would also consider a lightweight third-party dependency injection library to keep object creation and feature wiring more consistent.

4. Make TransactionTooltipView reusable

TransactionTooltipView is currently built for this transaction details screen. If this type of tooltip is needed in other parts of the app, I would make it generic by passing title, details, icon, and action text as configurable properties.

Tech Stack

- Swift
- SwiftUI
- Observation
- Swift Testing
